- 3- Tasks do not involve any risk of exposure to blood/body fluids.

Position Risk Category= 3

Hepatitis B

The hepatitis B virus infects the liver and can lead to liver failure, cancer and death. The hepatitis B virus is 100 times more contagious than HIV which causes AIDS. Hepatitis B is spread through blood and other bodily fluids.

Symptoms:

The infection may not cause you to feel sick. You can carry the virus without knowing it and infect others. Some symptoms are like the flu making you lose your appetite, feel exhausted, have stomach cramps and throw up. If you are more seriously affected, your eyes and skin may turn yellow with jaundice and you may require hospitalization.

Hepatitis B is found in blood and body fluids. It can be spread by sexual contact, from mother to infant during birth and by tattooing or body piercing with unsterile equipment. Once caught, it has no cure. There is however, prevention in the form of the hepatitis B vaccine. This is a series of three injections over a three month period. If you request to be vaccinated, you will be sent to the Health Department. All injections must be given in order for the vaccine to be effective. The vaccination is costly so it is imperative that you complete the series once beginning.

I have read the information regarding Hepatitis B and by signing below I am signifying that I have already received the vaccination.
